Abstract of the Disclosure

The apparatus comprises a framework having two angled arms, one flat portion of each arm adapted to be fixed to a rooftop. An upright extends upwardly from each arm and top and bottom cross members extend between and are fixed to the arms. Multiple arms, uprights and cross members are joinable together to accommodate a rooftop of any lateral extent. A net extends across the area defined by and between the uprights and cross members. Also, the arms include brace structure adapted for engaging scaffolding thereacross.
